

Effective alarm communication
is essential for your security.

Honeywell

Your security system relies upon phone lines to provide a communication path to report burglaries, fires or other events. If your phone lines are cut, the vital link between your security system and the central station may be lost.

What's more, some phone systems may not be compatible with your security system. Voice over Internet protocol (VOIP) phone service does not provide a reliable communication path due to its transmission characteristics.

Honeywell's AlarmNet service is a reliable alternative. Our cellular radio and Internet communicators integrate with your security system to provide an essential link to the central station – helping ensure that signals get through.

Consult your security professional for additional information.
