

PREPARING FOR
WHAT COMES NEXT

Honeywell is here to help.

In life, we all experience setbacks from time to time. It seems like international news agencies frequently report about crisis events around the world. Sometimes the crisis occurs here at home. The key to recovering successfully from a regional crisis is to have a plan in place when it strikes. Furthermore, to really make it through a crisis, you must plan beyond its initial event. Planning for fires, floods, looting, and riots is becoming more essential. Planning for communication and power outages, and shortages of food and water after the event can help you get through the tough weeks to come. Honeywell can provide assistance during these critical times.

When telephone lines are down, the greatest losses occur when authorities cannot effectively react. Honeywell is here to help. We are uniquely equipped to provide you with the tools and services to help minimize the effects of system damage and communication outages resulting from a regional crisis caused by man or Mother Nature. We have resources to serve engineers, system designers, building and fire authorities and system contractors.

Honeywell

Engineers and Security Dealers

Honeywell can provide you with the vital support that you need to get the job done, meeting or exceeding the AHJ's requirements. We provide quick access to submittal documentation, design information, and specification creation. If the plans are stacking up on your desk, let us help you gather the information needed to process the increased workload. If your staff requires technical support, please contact our offices or visit our web site. We are here to help.

We can help you quickly fix critical system communication issues today, and solve them for tomorrow. We offer commercially listed hardwire and wireless systems that can help protect a building from fire and looting. If your project suffers from a damaged system, our system can restore communication to the monitoring center, and restore protection to the building. Our systems do not depend on vulnerable telephone lines in order to provide protection. What's more, our systems are incredibly easy to install and easy for your customers to use.

Business Owners and Managers

You can work a lifetime building your business. Should a regional crisis occur, make sure you do everything within your power to protect it. Honeywell can maintain the vital communication link between your facility and the central monitoring station even when phone lines fail, helping you manage risks related to fire, flood, looting and riots. The central station is notified even during a time of crisis—helping ensure that the proper authorities such as the police, fire department, emergency medical personnel or other designated representatives are dispatched to the premises. When a community's telephone lines fail, we are still on the air, receiving critical signals from connected systems. When the power fails, our systems

include standby batteries that keep them operating. Your security contractor can help you to decide the best choices for how long you want the system to operate in the event of long-term power failures.

This helps you minimize the loss of office supplies, stocked product, equipment and critical documents. Remember, whether power or phone lines are disrupted or destroyed, you can have peace of mind knowing that Honeywell systems can still communicate with the central station.

Government Agencies

Honeywell realizes that as a government agency, your requirements are unique—especially after a natural or man-made disaster. We can help with design and application assistance and protect critical agencies, buildings, equipment and sensitive data or documentation. Our goal is to help get your facility back under the protection of a monitored system as quickly and efficiently as possible—even in the event of power or electricity failure. We are GSA listed, and employ a technical support team chosen for their expertise, knowledge and solid understanding of your special security concerns.

Authorities Having Jurisdiction (AHJ)

Honeywell offers a broad range of fire alarm and security systems that meet UL listings, are approved for use in cities around the country and around the world. Should communications systems fail, we are equipped to react to the disaster to get things up and running—appropriately and immediately—with a broad range of products that meet stringent UL, CSFM, MEA, FM and other Listing agency requirements.
