New Domonial Vision solution

A Wireless Home Security System

BENEFIT FROM PEACE OF MIND
The new Domonial Vision

Optimal security assured

Our security expertise at your service
Established in 1923 and with more than 50 million alarm systems installed worldwide, Honeywell is an unrivalled player in the world of security. From the individual homeowner to the most demanding industries, around one million clients trust their security to us every year.

Today, over 500 engineers work on our leading-edge technology, developing solutions that are more secure and adaptable to individuals lifestyles.

Honeywell provides around-the-clock security for your possessions.

An alarm system: Why?
Equipping your door with a security lock and closing and locking your windows when you go out, are simple measures which you can take to protect your home. They provide the first level of defence in your home and slow down any intruder. The alarm system completes these security measures and dissuades intruders from attempting to break in.

If someone tries to break in, the system detects this and activates a siren to alert the neighbourhood and discourage the intruder.

Alarm Monitoring: Delivering an efficient alarm system
To ensure perfect protection of any property, it is crucial to link the alarm system to a centre that specialises in alarm handling and that is accredited by the authorities: the Alarm-Receiving Centre (ARC).

Each time an alarm is set off, an ARC operator is immediately alerted. The operator analyses the cause of the alarm and if the intrusion is genuine security personnel or the police are called to the site. To be completely effective, the operator must immediately distinguish an alarm caused by an intruder from that caused by a pet or a window left open.

The proof is in the image: The reassurance of efficient alarm monitoring
Many alarm messages are not generated by intrusions. Doors, left ajar, animals shut in, distracted owners… all harmless events which are systematically forwarded to the operator.

In this situation, intervention is not necessary, but when it is a case of burglary, every minute counts. Today, photographic images are the most reliable and rapid tool for verification.

Thanks to images, the operator can see the cause of the alarm, and act immediately with full knowledge of the facts.

Optimal protection using image transmission
Honeywell was the first manufacturer to produce wireless alarm sensors with an integral camera. The 150,000 systems that have been installed since then have proven the effectiveness of this technology in handling alarms. The Domonial Vision solution integrates the latest generation of sensors with our wireless alarm panels.

The new sensors offer exceptional detection performance and picture quality, ensuring efficient alarm handling by your Alarm Receiving Centre. In addition, the sensors are discreet and need no flash, even at night. Images are only taken when an intrusion is detected, safeguarding your privacy in your home.

Your home security measured by a system dedicated to alarm monitoring
Domonial was designed to be a monitored alarm system, with specific focus on the alarm receiving centre. For over 15 years, we have been following the continual evolution of telecommunications to ensure the reliability of alarm transmissions to your Alarm Receiving Centre. Today, Domonial works with every telecommunications network: PSTN – fixed telephone lines, Broadband (ADSL, GSM, GPRS). In the case of failure of any one network, Domonial switches to another network to transmit the alarm.

Your security is assured, no matter what the situation.

The permanent protection of your home
With Domonial, your house is protected around the clock, whether you are at home or away. The portable keypad allows you to set the alarm, from any room, even at night. An effective way to avoid nasty surprises. You can also protect your garage permanently, day and night, whether the alarm is set in the rest of your house or not.

Lastly, to enhance your home protection even more, smoke detectors can be integrated into your security system. If a fire occurs, the siren will alert you with a specific sound and your Alarm Receiving Centre is also alerted, and will investigate and respond appropriately.

Simplicity of use giving greater peace of mind
With Domonial, you can protect your family without adding constraints to your daily life. Our keypads are even equipped with a proximity card and tag reader, allowing each member of the family to set or unset the alarm in one single movement without having to remember a PIN code. For greater reliability, the remote control also allows you to control your system from the outdoors. To avoid any risk of error, it tells you whether or not the system is set and confirms the correct execution of every command. So you can go out and return home without any worries.

Equipment that is discreet and blends with your decor
The walls of your home remain hole and cable free. The Domonial control panel, keypads and sensors, are linked by radio signals. The system is installed simply and rapidly by a professional. The radio connection is completely secure. The system components regularly send the panel signals indicating that they are functioning correctly, and any attempt to jam the radio signal is immediately detected and notified to the Alarm Receiving Centre.
The new Domonial system
Made-to-measure protection for your home

1. Domonial control panel
   - The panel communicates with all the devices in your system. It handles and analyses the information sent by the sensors and control equipment. It sets off the sirens and provides the link between you and the alarm receiving centre.

2. Passive infrared motion sensor
   - Positioned inside the property, this sensor detects movement of a potential intruder. This wireless sensor blends discreetly into your décor. When the system is active, it can distinguish between your pet and a real intrusion.

3. Motion sensor with integral camera
   - This motion detector has a built-in camera allowing a series of photos to be taken in the event of an intrusion. These are transmitted to the alarm receiving centre via the control panel.

4. Miniatuised door/window contacts
   - These contacts detect the opening of a door or window.

5. Portable LCD keypads or LED keypads
   - The keypad is the principal control device that enables interaction with the control panel. There is a full range of keypads offering differing functionality:
     - TCU: Portable LCD keypad with proximity card reader
     - CSK: LED keypad with proximity card reader
     - CLI: LED code-operated keypad

6. Internal siren
   - Dissuasive siren positioned inside the property and with a sound level of 115 dB. It deters intruders without being a nuisance to neighbours.

7. Smoke detector
   - Triggers in the presence of smoke, emitting a loud siren to alert the property occupants.
   - Protection in the case of fire.

8. 2 Way Voice Speaker microphone
   - Communication with the intruder by loudspeaker.
   - Dedicated link with your alarm receiving centre.
   - The second point of communication in addition to communication via the control panel.

9. Shock sensor
   - Installed on a door or window, this sensor detects any attempt at forced entry.

10. External siren with strobe
    - A loud siren installed on the outside of the property equipped with a strobe light which is easily seen by neighbours or police.
